21 November 2016 Migrate an Access database to share on the Web with Antrow Software MS-Access web controls

Applies To: Access 2010, Access 2011, Access 2012, Access 2013, Access 2014, Access 2015, Access 2016

You can use new components of Antrow Software MS-Access web controls to build or convert database to web applications.

This helps you:

Secure and manage access to your data

Share data throughout an organization, or over the Internet

Note: A user account is required to use a web database. Anonymous access is not supported.

Overview

Antrow Software MS-Access web controls provide a platform for you to create or migrate databases that you can use on the Web.

You design and publish a web database by using the Antrow Web controls, and people who have database accounts use the web database in a web browser.

How it works

When you publish a web database, Antrow creates an internet site that contains the database. All of the database objects and data move to internet lists in that site.

After you publish, Internet/Intranet visitors can use your database, based on their permissions for the website.

Full Control: This lets you make data and design changes.

Contribute: This lets you make data changes, but not design changes.

Read: This lets you read data, but you can't change anything.

Forms and reports run in the browser

Forms, reports, and most macros run inside the browser. This lets your website refresh data on the screen without having to redo the whole page.

You can create a form to help people navigate your application. A new control, the Antrow Software MS-Access web Navigation control, makes it easy to add standard Web-style navigation buttons to a webform for this purpose.

Queries and data macros run on the server

All SQL database processing happens on the server. This helps improve network performance by limiting traffic to result sets.

Intranet or Internet

You can publish to your own intranet server, or to the Internet. Antrow, Microsoft, Google and Amazon is offering an Internet-facing, hosted solution.
